

With the marketplace demanding rapid access to current information, documents have become increasingly fluid to keep up with evolving delivery channels. These "living" documents have short life spans and are updated frequently as they share content with Internet sites, extranets, intranets, portals and "just-in-time" print solutions.

## MANAGE RAPIDLY EVOLVING DOCUMENTS WITH RHYTHMYX

Rhythmyx™ is the only enterprise content management system architected for efficient content reuse among all channels, providing an integrated Document Management Module that interacts seamlessly with content from all sources. With its Active Assembly™ for Documents capability, Rhythmyx's Document Management Module surpasses traditional systems, allowing you to create new, compound documents from existing content including other documents, images, text and XML content items.

Rhythmyx allows you to contribute documents directly from enterprise applications including Microsoft® Word. With the Rhythmyx Connector for Microsoft Word, you can save content directly to Rhythmyx as well as place Rhythmyx-managed images in documents and insert in-line links to other managed content. When documents are edited or updated, Rhythmyx allows you to identify content changes and preview how the changes will affect document layout with its document comparison capabilities.

*Active Assembly for Documents enables you to reassemble content into compound documents that easily adapt to frequent edits and updates.*

Once document content is in the system, you can combine it with content from other sources to make new documents. With its Active Assembly for Documents capability, Rhythmyx provides a browser-based interface where you can graphically organize and assemble content into any document structure that you define. You can drag and drop content into document sections from search results, from other document sections, and from the Content Explorer interface.

As you combine existing content to build new documents, Rhythmyx manages reuse by automatically establishing Intelligent Relationships that track the dependencies and connections between content. Intelligent Relationships allow you to keep living documents current offering extensive, automated change management capabilities.

Using Rhythmyx's De-Coupled Delivery™ capability, you can then cost-effectively deliver documents in XML, HTML, PDF, QuarkXPress™, Microsoft Office, and other formats.

## KEY CAPABILITIES

- Create documents that conform to any industry-standard or corporate-specific format
- Control the type and format of content allowed in specific document sections
- Search for content items in multiple formats, and instantly determine which formats are usable in a specific document section
- Drag and drop content from search results, from other document sections, or from the Content Explorer interface
- Assemble content in an ad-hoc fashion without technical assistance
- Output XML, HTML, PDF, QuarkXPress, Microsoft Office, and other document formats
